Overview of Automated Immunohistochemistry

Jeffrey W. Prichard, DO

• Context.—The increasing demand for immunohistochemistry for clinical diagnostics, in combination with an ongoing shortage of staff in the histology laboratory, has brought about a need for automation in immunohistochemistry. The current automated staining platforms vary significantly in their design and capabilities.

Objective.—To review how technology has been applied to automating the process of immunohistochemical staining.

Data Sources.—Literature review, vendor interviews, and personal practice experience.

Conclusions.—Each of the commercially available, automated immunohistochemistry platforms has strategic design differences that produce advantages and disadvantages. Understanding those differences can help match the demands of testing volumes, turnaround time, standardization, and labor savings to the appropriate automated instrumentation.

(Arch Pathol Lab Med. 2014;138:1578–1582; doi: 10.5858/arpa.2014-0083-RA)

Immunohistochemical staining procedure is a multiplex technique requiring a lot of hands-on when performed manually.

From deparaffination to counterstaining the IHC procedure at minimum requires 60-100 manual interactions and handling procedure on each slide to be stained. Capacity ?? (50-100 slides pr tech.*)

Preparation – sorting, deparaffination, epitope retrieval....

Application of reagents - pippetting

Secure even distribution – "Pap-pen"

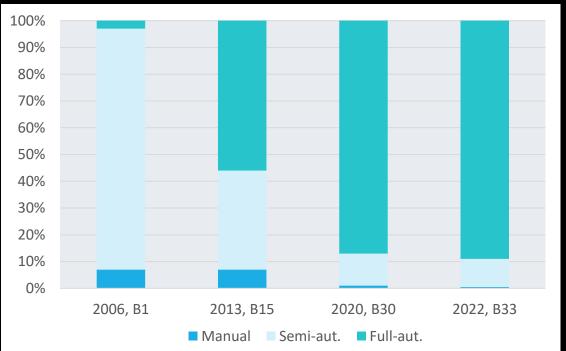

Avoid evaporation / secure moist – staining trays

^{*} Haines DM, Chelack BJ. Technical considerations for developing enzyme immunohistochemical staining procedures on formalin- fixed paraffin-embedded tissue for diagnostic pathology. J Vet Diagn Invest 1991; 3:101-12

IHC – Immunohistochemical stainers – NQC ER

Change from semi-automated IHC platforms to fully-automated platforms

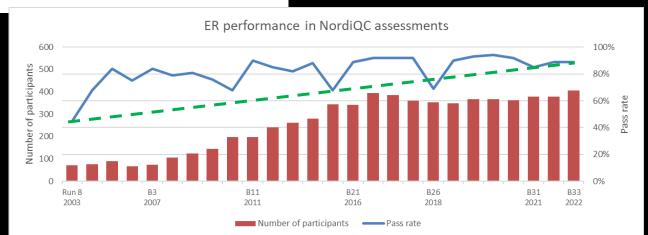

80's

90-00's

10-20's

Automation of the IHC staining procedure:

- 1. To secure and improve consistency of the IHC assay compared to manual performance; intra- and inter-laboratory
- 2. Reduce the technician workload used for IHC
- 2021: Fully automated with focus on 4 core elements
 - Deparaffination
 - Epitope retrieval (HIER and/or proteolysis)
 - IHC protocol (1 or 2 markers)
 - Counterstaining

Capillary; BOND Leica, Omnis Dako, Genie Sakura Flat labelling; BenchMark Ventana, Oncore Biocare, (AS48 Dako)

Capillary gap technology stainers:

Dako: Dynamic gap

Sakura: Glass Lid "upside down" Capillary

Technique;

To spread reagents and to avoid slides drying out

Flat labelling technology stainers:

Ventana: +Mixing +Overlay

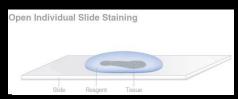

Dako:
-Mixing
-Overlay

Technique;

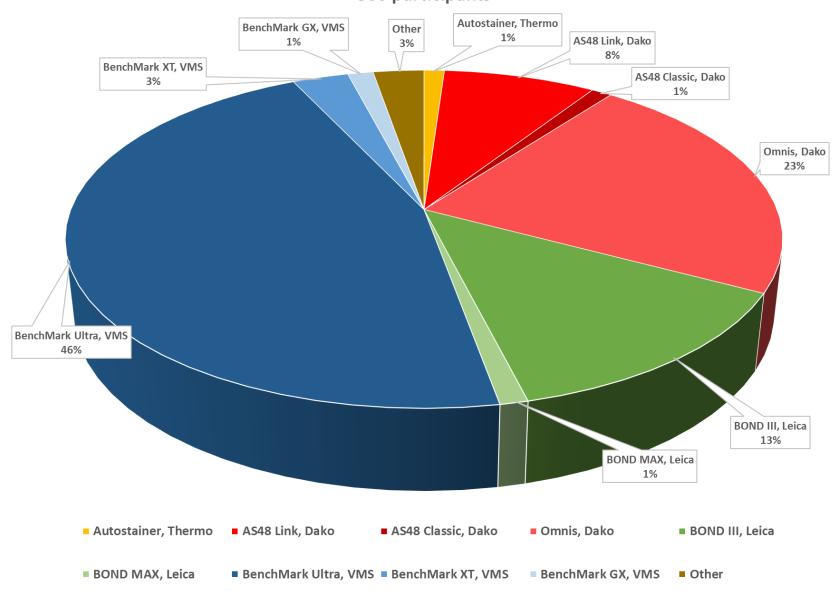

Reagents are applied +/- mixing +/- overlay

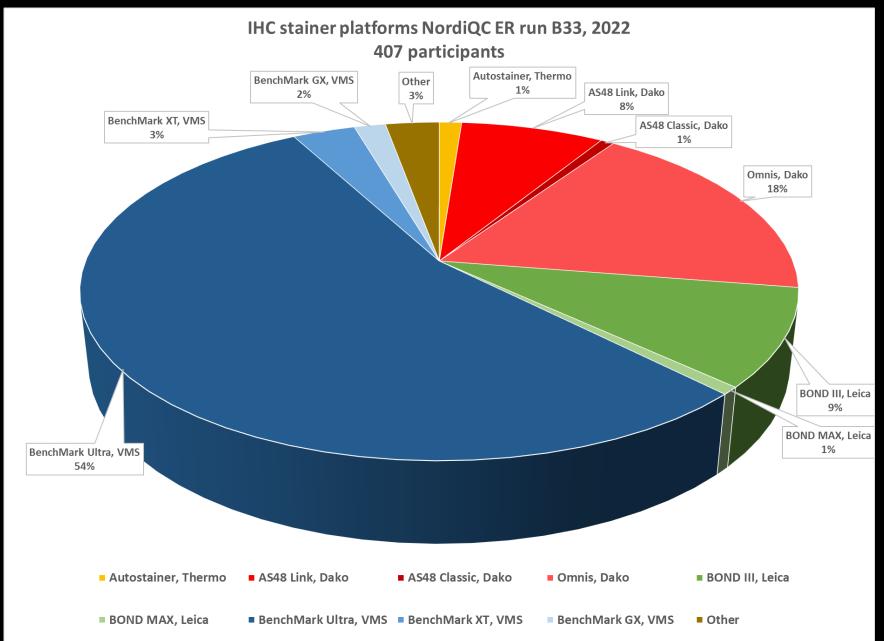

Automation of the IHC staining procedure:

- 1. To secure and improve consistency of the IHC assay compared to manual performance; intra- and inter-laboratory
- 2. Reduce the technician workload used for IHC

Overview of Automated Immunohistochemistry

Jeffrey W. Prichard, DO

• Context.—The increasing demand for immunohistochemistry for clinical diagnostics, in combination with an ongoing shortage of staff in the histology laboratory, has brought about a need for automation in immunohistochemistry. The current automated staining platforms vary significantly in their design and capabilities.

Objective.—To review how technology has been applied to automating the process of immunohistochemical staining.

Data Sources.—Literature review, vendor interviews, and personal practice experience.

Conclusions.—Each of the commercially available, automated immunohistochemistry platforms has strategic design differences that produce advantages and disadvantages. Understanding those differences can help match the demands of testing volumes, turnaround time, standardization, and labor savings to the appropriate automated instrumentation. (Arch Pathol Lab Med. 2014;138:1578–1582; doi:

10.5858/arpa.2014-0083-RA)

"If you understand the needs of your laboratory and the capabilities of the various systems, you can find the best fit for your laboratory."

"If an automated IHC platform is chosen correctly to match the demands of testing, automation can provide necessary process improvement and cost savings needed in the modern practice of pathology."

"When evaluating automated staining systems, the first thing to understand is that there is no, one "best system" on the market, for all purposes."

Automation of the IHC staining procedure:

- Sample type FFPE / Cytology / Frozen sections
- Baking of slides
- Deparaffination
- Pre-treatment HIER and proteolysis
- Combined retrieval HIER+proteolysis / proteolysis+HIER
- Continuous loading
- Batch loading
- IHC / ISH ?
- Coverslipping
- Temperature controlled slides, reagents
- Waste handling amount, separation
- Requirement of special utensiles containers, slides, lids

Automation of the IHC staining procedure:

- Capacity pr run, .. day, .. week (no of units back-up..)
- Place, start and walk
 - Interactions required e.g. chromogen stability
- Sequential process
 - one instrument for all steps
- Parallel process
 - e.g. one instrument for HIER, one instrument for IHC
- Batch versus continuous load of slides
 - "Whole" working process in dept must be incorporated
- Technician ressources for maintenance
 - Frequency, extent, safety etc

Automation of the IHC staining procedure:

- Software
 - Protocol set-up
 - HIER settings time, temperature
 - Retrieval methods single, combined
 - Adjustment of incubation times Ab, detection, etc
 - Adjustment of incubation temp Ab, proteolysis
 - Adjustment of protocol sequence H₂O₂ etc
 - Adjustment of reagent volume
 - Modification of protocol steps addition/removal
 - Washing conditions of low affinity Abs

Automation of the IHC staining procedure:

- Reagents
 - HIER reagents
 - How many and which HIER bufferes are offered?
 - Can 3' party HIER bufferes be applied?
 - Proteolysis
 - Which proteolytic enzymes are offered
 - Can 3' party enzymes be applied
 - Primary antibody
 - 3' party antibodies ?
 - RTU antibodies available ?

Automation of the IHC staining procedure:

- Detection systems
 - Can 3' party detection system be applied?
 - Reactivity mouse-rabbit and other species ?
 - Universal (MR), mono-specific ?
 - Modularity can sensitivity be adjusted?
 - Amplification step, Linker, different systems etc
- Dual staining capabilities
 - Are different chromogens offered from vendor
 - Can 3' party chromogens be applied?
 - Simultaneously? (mono-specific system required)
 - Sequential ?

Automation of the IHC staining procedure:

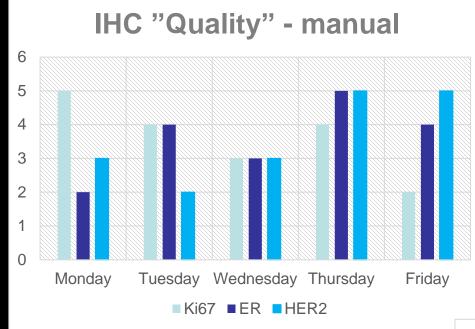

- Direct costs
 - Price pr instrument
 - Price pr slide
 - Preventive maintenance
- Indirect costs
 - Waste volumen
 - Daily maintenance (time used)
- "Hidden costs"
 - Down-period what is expected and accepted ?
 - Re-runs what is expected and accepted?
 - Assesscories needed/required
 - Empty vials for reagents, reagents, amp/linker, etc.

General module; Dako/Agilent Omnis RTU Type I products
NordiQC 2020-2021 pass-rates

General module; RTU & LDT IHC assays

Fully-automated systems: BenchMark Ultra, Ventana

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up "30 stainers"
- 3. Wide range of sensitivity for detection systems
- 4. Wide range of RTU primary antibodies Type I & II
- 5. IHC and ISH on same instrument / same slide

Fully-automated systems: BenchMark Ultra, Ventana

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up "30 stainers"
- 3. Wide range of sensitivity for detection systems
- 4. Wide range of RTU primary antibodies Type I & II
- 5. IHC and ISH on same instrument / same slide

3 main Cons:

- 1. Only CC1 applicable for HIER for IHC
- 2. Low affinity antibodies may show inferior performance
- 3. Maintenance time-consuming

Fully-automated systems: BOND III, Leica

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up e.g. combined retr.
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU antibodies plug-and-play

Fully-automated systems: Bond III, Leica

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up e.g. combined retr.
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU antibodies plug-and-play

3 main Cons:

- 1. Covertile technique precipitates and weak hue
- 2. Less flexible regarding continuous start 3 x 10 slides
- 3. Limited portofolio of detection systems DAB & RED

Fully-automated systems: Omnis, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Flexible reagent choice HIER buffers
- 2. Easy to use loading, programming
- 3. High capacity and high daily throughput
- 4. IHC and ISH on same instrument
- 5. Temperature controlled reagents

Fully-automated systems: Omnis, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Flexible reagent choice HIER buffers
- 2. Easy to use loading, programming, maintenance
- 3. High capacity and daily throughput
- 4. IHC and ISH on same instrument
- 5. Temperature controlled reagents

3 main Cons:

- 1. Limited portofolio of RTUs & detection systems
- 2. Low affinity antibodies may show inferior performance
- 3. Less flexible protocol set-up

Semi-automated systems: AS-48, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Flexible protocol set-up e.g. combined retr.
- 2. Flexible reagent choice HIER buffer, detection system
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU antibodies plug-and-play

Semi-automated systems: AS-48, Dako

Functionality – Workload – Workflow - Flexibility – Costs

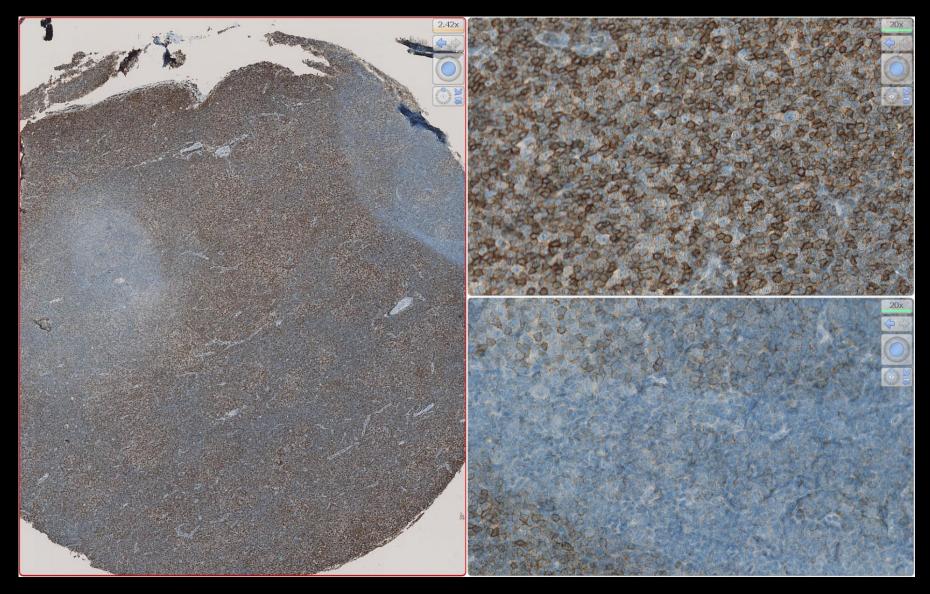

5 main Pros:

- 1. Flexible protocol set-up e.g. combined retr.
- 2. Flexible reagent choice HIER buffer, detection system
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Wide portofolio of RTU antibodies plug-and-play

3 main Cons:

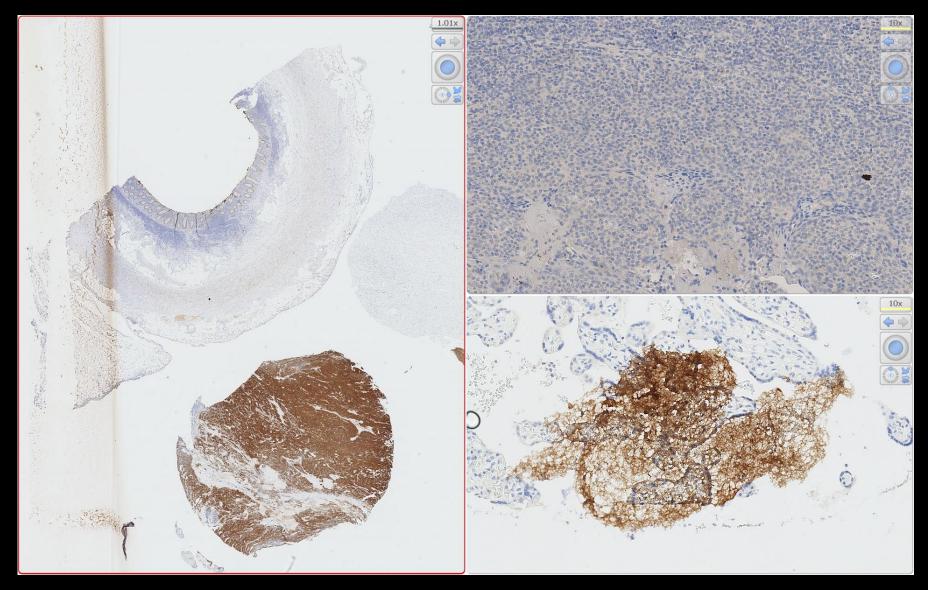

- 1. Increased manual interaction 2 instruments needed
- 2. Primarily batch operation
- 3. High reagent volumen needed 300 ul and >"dead-vol"

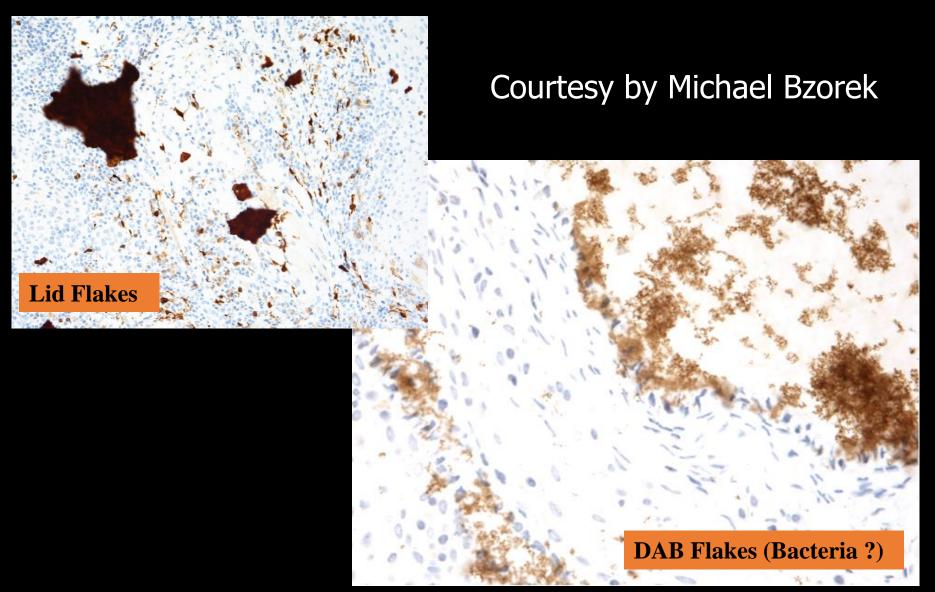

Staining issues; BenchMark, VMS – Uneven weak/neg areas – air bubbles

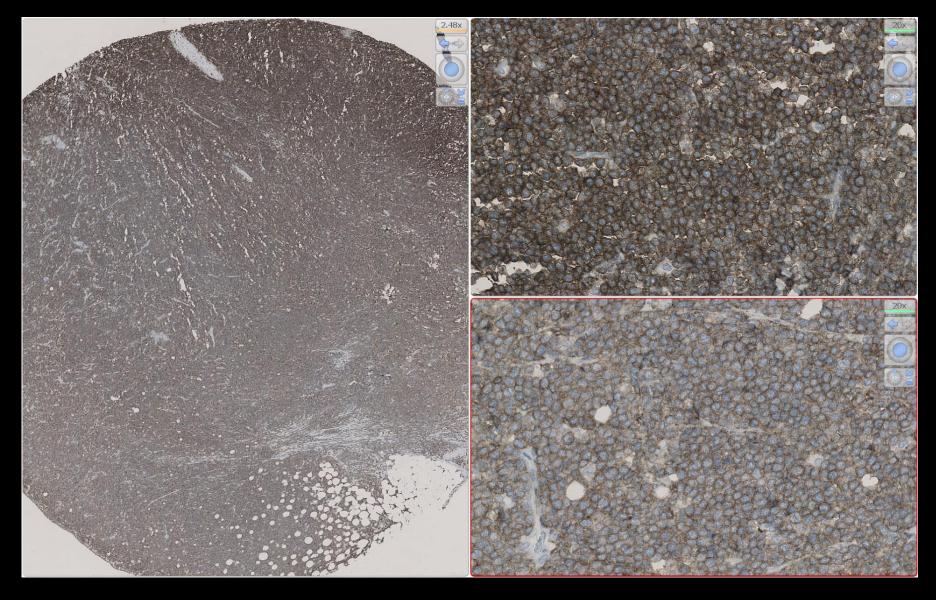

Staining issues; Bond, Leica – chromogen precipitates and general hue

Staining issues; Omnis, Dako – chromogen precipitates

Staining issues; AS48, Dako – chromogen depletion or reagent not spread

Paul E. Swanson, MD,¶¶## Xiaoge Zhou, MD,***††† Clive R. Taylor, MD, PhD,‡‡‡

and Mogens Vyberg, MD‡\$

TABLE 3. (continued)

Special Considerations

Cut and submit "own on-slide control" if sending patients' unstained slides to another laboratory for IHC testing The positive controls should match patients' sample tissue processing so far as is possible

This is difficult if the sender does

This is difficult if the sender does not know which IHC assays will be performed or if the sender does not have dIHC laboratory and has no positive controls

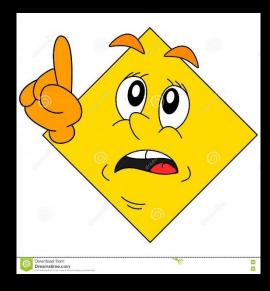

"Run" or "batch" positive controls are not recommended

Use on-slide positive controls

Without the date when the slides are prepared, it will be impossible to determine if a unexpected weak result is due to variation in protocol or to an "expired" positive control

Date unstained slides with on-slide Without the date when the slides controls are prepared, it will be impossible

dIHC indicates diagnostic immunohistochemistry; iCAPCs, immunohistochemistry critical assay performance controls; SOP, standard operating procedure.

"even for automated stainers, where it cannot be guaranteed that every slide in fact receives identical treatment".

An Audit of Failed Immunohistochemical Slides in a Clinical Laboratory: The Role of On-Slide Controls

Carol C. Cheung, MD, PhD, JD,*† Clive R. Taylor, MD, DPhil,‡ and Emina E. Torlakovic, MD, PhD†

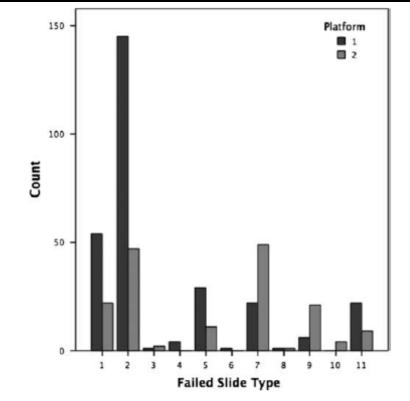

FIGURE 1. Frequency of failed immunohistochemistry slides by category and platform.

2% error rate (452/22.234 slides) Class I 0,8% - Class II 9,0%

TABLE 1						
TABLE 1. Categories of Failed IHC Slides Failed						
IHC Slide						
Category	Description	Comments				
1	On-slide control too weak, patient tissue negative	Correct primary Ab was applied, but test sensitivity is possibly too low				
2	On-slide control negative, patient tissue negative	Total slide failure; the result of the test does not suggest possible cause of the failure				
3	On-slide control too weak, patient tissue weakly positive but no internal control	May indicate decreased technical sensitivity				
4	On-slide control negative, patient tissue weakly positive but no internal control	There is uncertainty whether the correct primary Ab was applied or if there was significantly decreased sensitivity				
5	No on-slide control, patient tissue negative	Uncertain results; cannot distinguish if the staining was optimal, suboptimal, or total failure				
6	No on-slide control, patient tissue positive	No internal control present; lesion positive; failed only if there is uncertainty over whether the proper primary Ab was applied				
7	Failed signal-to-noise ratio	Usually too high background; potential false positive, involving both patient sample and on-slide external control				
8	Counter staining problem	If severe, may render result uninterpretable				
9	Wrong protocol	Wrong protocol selected when >1 protocol for the given primary Ab exists in the system				
10	Uneven staining	Large or critical areas of the patient tissue or controls were missed by uneven staining				
11	Wrong control	Either wrong tissue control or areas relevant to the test were missing (detached during staining or paraffin block with control tissue cut through)				
IHC indi	cates immunohistochemistry.	_ · ·

Category 1,2,3,4,7,8,10

Assay and/or Instrument (78%)

On-slide controls IHC slides stained for ALK (Class II), same run, same instrument, same protocol 14/19 passed 5/19 failed

Batch-control - Theoretically:

Batch control fail by same conditions as above 0/19 passed

19/19 failed (no consistent internal control...)

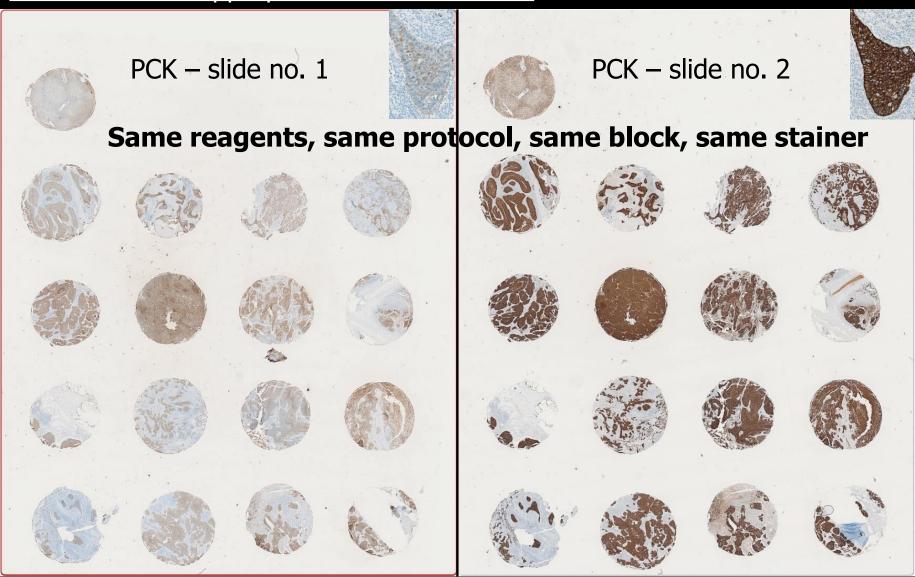

Batch-control - Theoretically:

Batch control pass by same conditions as above 19/19 passed

0/19 failed (the 5 failed slides not identified....)

Consider each slide position / chamber on the IHC stainer as an individual stainer and use appropriate on-slide controls

Automation in IHC reduces hands-on and improves consistency However the quality of the end result is less influenced by the function of the automated stainer compared to the impact of:

- Quality of the tissue material (pre-analytics)
 - Automation will not compensate for delayed fixation etc
- Quality of the reagents used (sensitivity, specificity analytics)
 - Use of detection system with low sensitivity etc
- Accuracy of the technical optimization and validation of the test
 - Use of RTU formats not adequately calibrated etc
- Interpretation of the test
 - Inadequate choice of control material etc

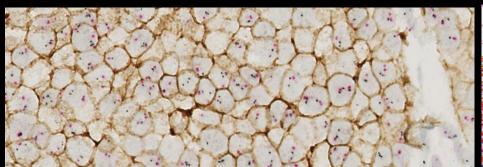

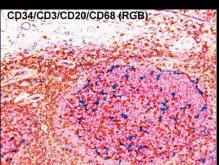

Fully-automated systems: Future ...???

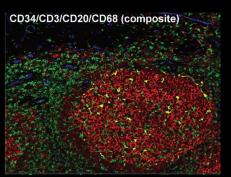

Functionality – Workload – Workflow - Flexibility – Costs

To come:

- 1. Multi-plexing
 - 1. IHC/ISH information on both protein and gene level
 - 2. IHC trible/quadrable staining less sample material
- 2. Reduced IHC staining time shorter TAT required
- 3. Ability to perform ISH for miRNA and similar gene targets
- 4. Increased demand for traceability of IHC process (ISO)
- 5. New "players" on the market

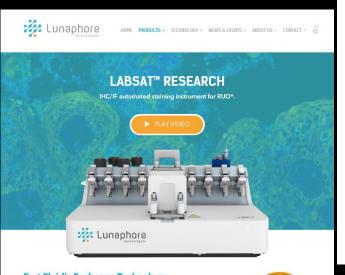

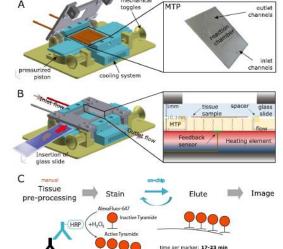

Fully-automated systems: Future ...???

Conclusions:

Automation in IHC is needed primarily to secure consistency of inter- and intralaboratory results and to reduce hands-on.

There is no perfect system \otimes all have pros and cons. Each laboratory has to select the system being most applicable and favourable for the needs and demands within the laboratory.

Use other laboratories to have a more objective view on the systems offered.

A combination of different systems might be the best solution, as the IHC tests can be performed on the system giving the best technical result and lowest price — drawback workflow....
