Overview of Automated Immunohistochemistry

Jeffrey W. Prichard, DO

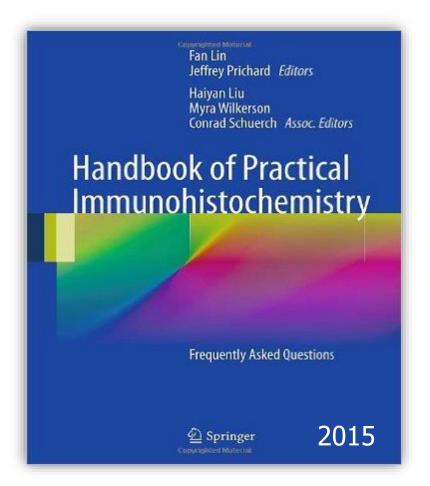

• Context.—The increasing demand for immunohistochemistry for clinical diagnostics, in combination with an ongoing shortage of staff in the histology laboratory, has brought about a need for automation in immunohistochemistry. The current automated staining platforms vary significantly in their design and capabilities.

Objective.—To review how technology has been applied to automating the process of immunohistochemical staining.

Data Sources.—Literature review, vendor interviews, and personal practice experience.

Conclusions.—Each of the commercially available, automated immunohistochemistry platforms has strategic design differences that produce advantages and disadvantages. Understanding those differences can help match the demands of testing volumes, turnaround time, standardization, and labor savings to the appropriate automated instrumentation.

(Arch Pathol Lab Med. 2014;138:1578–1582; doi: 10.5858/arpa.2014-0083-RA)

Abstract

The past decade has produced major innovations and a great variety of features available in automated staining instruments. This chapter is a "buyer's guide" for automated IHC instruments. For those new to the topic of automated staining, it begins with discussions of the advantages and disadvantages of automated versus manual staining techniques to help you decide if automation is the right choice for your laboratory. The basics of the general types of mechanics that differentiate the platforms are illustrated. Industry jargon about "open" and "closed" systems is better defined. To help with creating a thoughtful business plan to justify the budget expense of automation, the considerations that include the cost and potential savings of operating the equipment over and above the purchase price are presented. The different strategies for slide capacity and continuous processing that affect overall test throughput are described. A comprehensive feature comparison table is included to reveal how the current clinical instruments stack up side by side. With the information in this chapter, you will know how to evaluate whether an instrument is right for you and understand the value of technological advancements as they arrive in the future.

Automation of the IHC staining procedure:

- 1. To secure and improve consistency of the IHC assay compared to manual performance; intra- and inter-laboratory
- 2. Reduce the technician workload used for IHC

2024: Fully automated with focus on 4 core elements

- Deparaffination
- Epitope retrieval (HIER and/or proteolysis)
- IHC protocol (1 or 2 markers)
- Counterstaining

Capillary; BOND and Prime Leica, Omnis Dako, Genie Sakura

Flat labelling; BenchMark Ventana, Oncore Biocare, (AS48 Dako)

Capillary gap technology stainers:

Leica: <u>Covertiles</u> Capillary

Dako: <u>Glass Lid</u> Dynamic gap

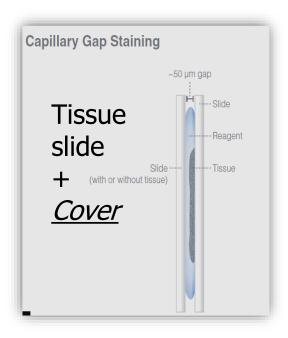

Sakura: "<u>upside down</u>" Capillary

Technique;

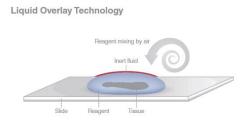

To spread reagents and to avoid slides drying out

Flat labelling technology stainers:

+Overlay

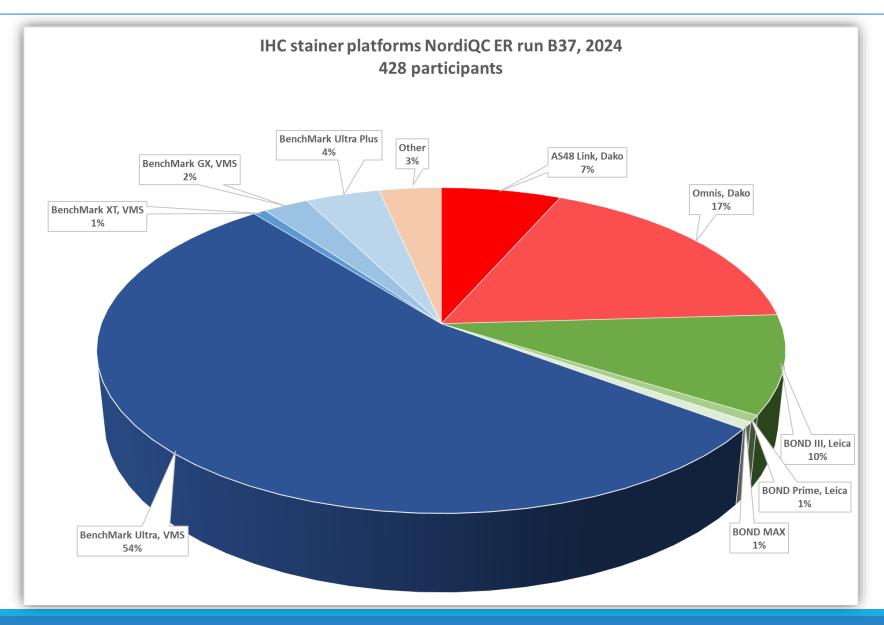

Technique;

Reagents are applied +/- mixing +/- overlay

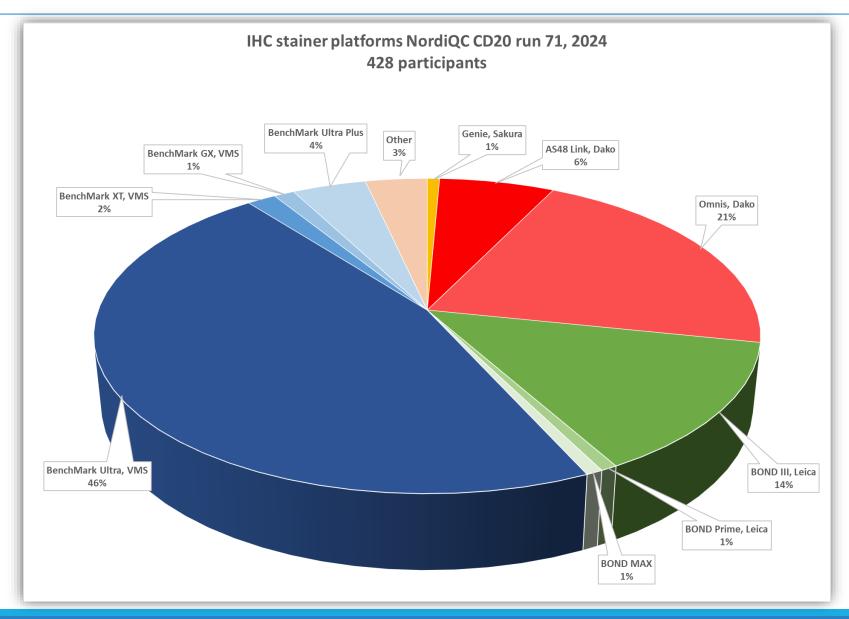

Open Individual Slide Staining

Automation of the IHC staining procedure:

- 1. To secure and improve consistency of the IHC assay compared to manual performance; intra- and inter-laboratory
- 2. Reduce the technician workload used for IHC

Overview of Automated Immunohistochemistry

Jeffrey W. Prichard, DO

• Context.—The increasing demand for immunohistochemistry for clinical diagnostics, in combination with an ongoing shortage of staff in the histology laboratory, has brought about a need for automation in immunohistochemistry. The current automated staining platforms vary significantly in their design and capabilities.

Objective.—To review how technology has been applied to automating the process of immunohistochemical staining.

Data Sources.—Literature review, vendor interviews, and personal practice experience.

Conclusions.—Each of the commercially available, automated immunohistochemistry platforms has strategic design differences that produce advantages and disadvantages. Understanding those differences can help match the demands of testing volumes, turnaround time, standardization, and labor savings to the appropriate automated instrumentation.

(Arch Pathol Lab Med. 2014;138:1578–1582; doi: 10.5858/arpa.2014-0083-RA)

"If you understand the needs of your laboratory and the capabilities of the various systems, you can find the best fit for your laboratory."

"If an automated IHC platform is chosen correctly to match the demands of testing, automation can provide necessary process improvement and cost savings needed in the modern practice of pathology."

"When evaluating automated staining systems, the first thing to understand is that there is no, one "best system" on the market, for all purposes."

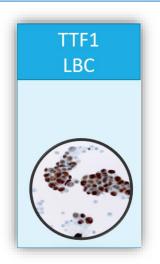

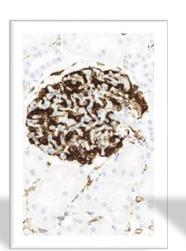

Automation of the IHC staining procedure:

Functionality – Workload – Workflow - Flexibility – Costs

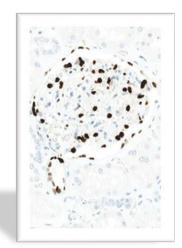

- Sample type FFPE / Cytology / Frozen sections
- Baking of slides
- Deparaffination
- Pre-treatment HIER and proteolysis
- Combined retrieval HIER+proteolysis / proteolysis+HIER
- Continuous loading
- Batch loading
- IHC / ISH ?
- Coverslipping
- Temperature controlled slides, reagents
- Waste handling amount, separation
- Requirement of special utensiles containers, slides, lids

•

WT1 6F-H2 HIER + Prot.

Automation of the IHC staining procedure:

- Capacity pr run, .. day, .. week (no of units back-up..)
- Place, start and walk
 - Interactions required e.g. chromogen stability
- Sequential process
 - one instrument for all steps
- Parallel process
 - e.g. one instrument for HIER, one instrument for IHC
- Batch versus continuous load of slides
 - "Whole" working process in dept must be incorporated
- Technician ressources for maintenance
 - Frequency, extent, safety etc

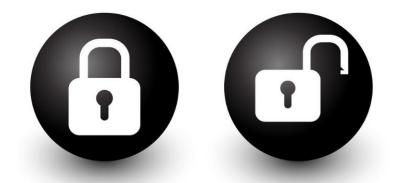

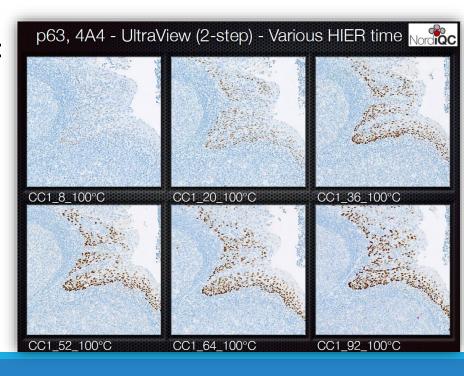

Automation of the IHC staining procedure:

- Software
 - Protocol set-up
 - HIER settings time, temperature
 - Retrieval methods single, combined
 - Adjustment of incubation times Ab, detection, etc
 - Adjustment of incubation temp Ab, proteolysis
 - Adjustment of protocol sequence H₂0₂ etc
 - Adjustment of reagent volume
 - Modification of protocol steps addition/removal
 - Washing conditions of low affinity Abs

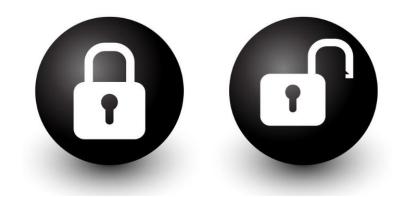

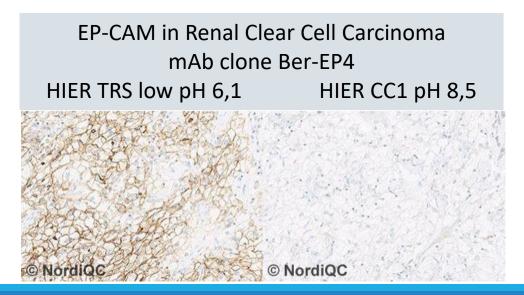

Automation of the IHC staining procedure:

- Reagents
 - HIER reagents
 - How many and which HIER buffers are offered?
 - Can 3' party HIER buffers be applied?
 - Proteolysis
 - Which proteolytic enzymes are offered
 - Can 3' party enzymes be applied
 - Primary antibody
 - 3' party antibodies ?
 - RTU antibodies available ?

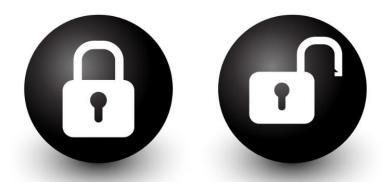

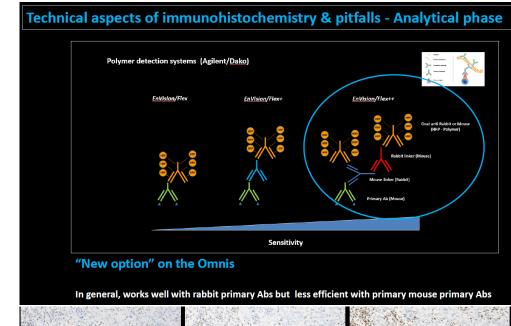

Automation of the IHC staining procedure:

- Detection systems
 - Can 3' party detection system be applied?
 - Reactivity mouse-rabbit and other species ?
 - Universal (MR), mono-specific?
 - Modularity can sensitivity be adjusted?
 - Amplification step, Linker, different systems etc
- Dual staining capabilities
 - Are different chromogens offered from vendor
 - Can 3' party chromogens be applied?
 - Simultaneously ? (mono-specific system required)
 - Sequential ?

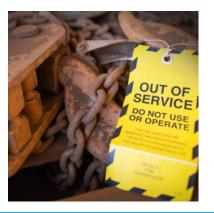

Automation of the IHC staining procedure:

- Direct costs
 - Price pr instrument
 - Price pr slide
 - Preventive maintenance
- Indirect costs
 - Waste volumen
 - Daily maintenance (time used)
- "Hidden costs"
 - Down-period what is expected and accepted ?
 - Re-runs what is expected and accepted ?
 - Assesscories needed/required
 - Empty vials for reagents, reagents, amp/linker, etc

Mitigation of RTU from one system to another can be challenging

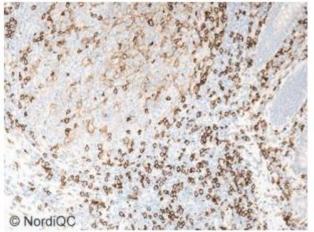

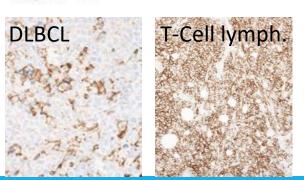

Fig. 1a (x200) Optimal staining reaction for CD4 of the appendix applying the RTU assay IR649 (Autostainer, Dako/Agilent) based on the mAb clone 4B12, following vendor recommended protocol settings based on HIER in TRS (3-in-1) pH 9 and Envision FLEX+ as detection system.

All T-helper/inducer cells show a strong and distinct membranous staining reaction. The germinal centre macrophages display a weak to moderate staining intensity. No staining reaction was observed in B-cells and epithelial cells of the appendix. Same protocol used in Figs. 2a - 4a.

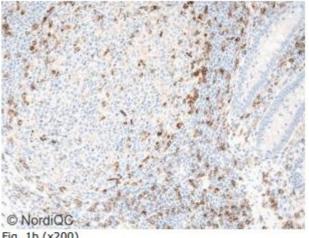

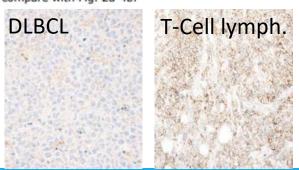

Fig. 1b (x200)

Insufficient staining reaction for CD4 of the appendix applying the same RTU system as in Fig. 1a, but used on the fully automated instrument Omnis (Dako/Agilent) with similar protocol settings as in Fig 1a - same protocol used in Figs. 2b - 4b.

The staining intensity is significantly reduced in Thelper/inducer cells and germinal centre macrophages are false negative or only faintly demonstrated. This antibody clone provides too low analytical sensitivity on this particular platform (see description above) and should prompt laboratories to substitute to a robust primary Ab as e.g., the rmAb clones SP35 or EP204 compare with Fig. 2a-4b.

Pass rates for RTU's on "non-intended" platform;

	IR649 4B12 AS 48 Link	IR649 4B12 Omnis	Alternative clone* Omnis
CD4	93% (13/14)	0% (0/28)	100% (21/21)
	IR606 D33 AS 48 Link	IR606 D33 Omnis	Alternative clone** Omnis
Desmin	67% (18/27)	5% (2/37)	100% (7/7)

* SP35, ** BS21

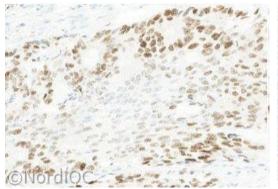

p53 run 38, 2013;

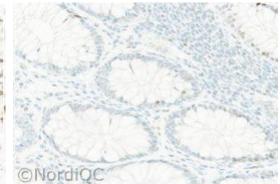

Purpose being demonstration of overexpression of p53 protein caused by TP53 mutation

p53 run 38, 2013;

Dako/Agilent RTU; 88% pass rate as "plug-and-play"

Same level for other systems

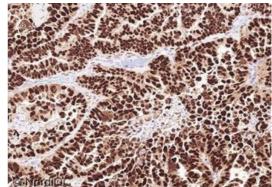

p53 run 63, 2021;*

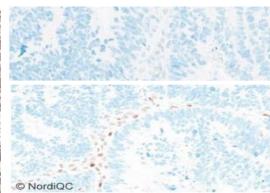

Purpose being demonstration of overexpression **and loss** of p53 protein caused by TP53 mutations

p53 run 63, 2021;*

Dako/Agilent RTU; 3% pass rate as "plug-and-play"

Same level for other systems

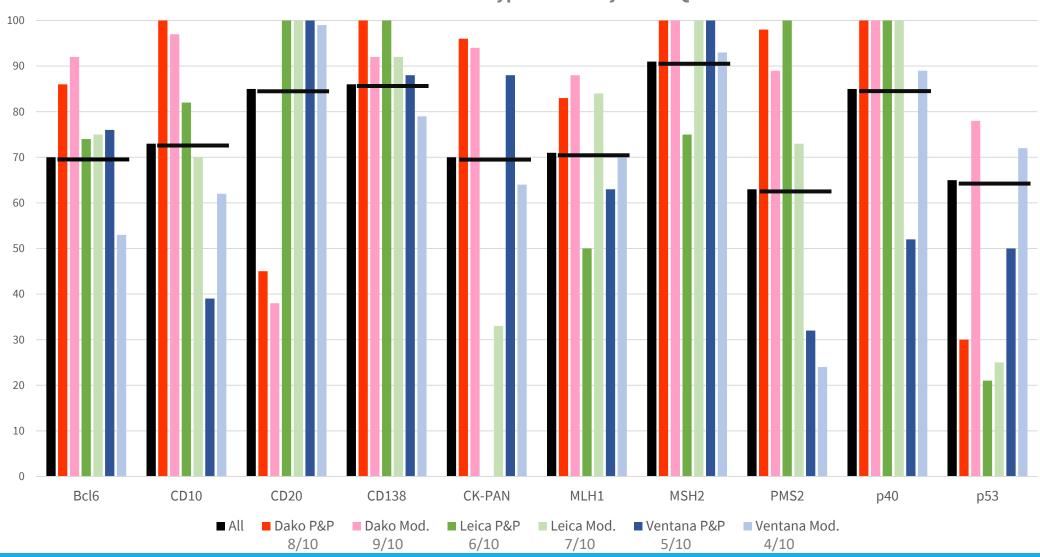

IHC assays including RTU systems must always be developed and validated for its purpose(s)

^{*} Same criteria and pass rates observed in subsequent runs 65, 67 and 70....

IHC – NordiQC pass rates for RTUs; Omnis, Bond and Ultra

Fully-automated systems: BenchMark Ultra / Ultra PLUS, Ventana

Functionality - Workload - Workflow - Flexibility - Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up "30 stainers"
- 3. Wide range of sensitivity for detection systems
- 4. Wide range of RTU primary antibodies Type I & II
- 5. IHC and ISH on same instrument / same slide

<u>Fully-automated</u> systems: BenchMark Ultra / Ultra PLUS, Ventana

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up "30 stainers"
- 3. Wide range of sensitivity for detection systems
- 4. Wide range of RTU primary antibodies Type I & II
- 5. IHC and ISH on same instrument / same slide

3 main Cons:

- 1. Only CC1 applicable for HIER for IHC
- 2. Low affinity antibodies may show inferior performance
- 3. Maintenance time-consuming

<u>Fully-automated</u> systems: BOND III, Leica

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up e.g. combined retr.
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU antibodies plug-and-play

Fully-automated systems: BOND III, Leica

Functionality - Workload - Workflow - Flexibility - Costs

5 main Pros:

- 1. Place, start, walk
- 2. Flexible protocol set-up e.g. combined retr.
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU antibodies plug-and-play

3 main Cons:

- 1. Covertile technique precipitates and weak hue
- 2. Less flexible regarding continuous start -3×10 slides
- 3. Limited portofolio type II assays (CDx assays PD-L1 etc)

Fully-automated systems: Omnis, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Flexible reagent choice HIER buffers
- 2. Easy to use loading, programming
- 3. High capacity and high daily throughput
- 4. IHC and ISH on same instrument
- 5. Temperature controlled reagents

Fully-automated systems: Omnis, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- 1. Flexible reagent choice HIER buffers
- 2. Easy to use loading, programming
- 3. High capacity and high daily throughput
- 4. IHC and ISH on same instrument
- 5. Temperature controlled reagents

3 main Cons:

- 1. Limited portofolio of RTUs (I & II) & detection systems
- 2. Low affinity antibodies may show inferior performance
- 3. Less flexible protocol set-up

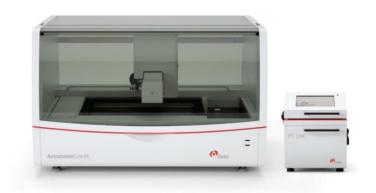

Semi-automated systems: AS-48, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

- Flexible protocol set-up e.g. combined retr.
- 2. Flexible reagent choice HIER buffer, detection system
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU's type I & II plug-and-play

Semi-automated systems: AS-48, Dako

Functionality – Workload – Workflow - Flexibility – Costs

5 main Pros:

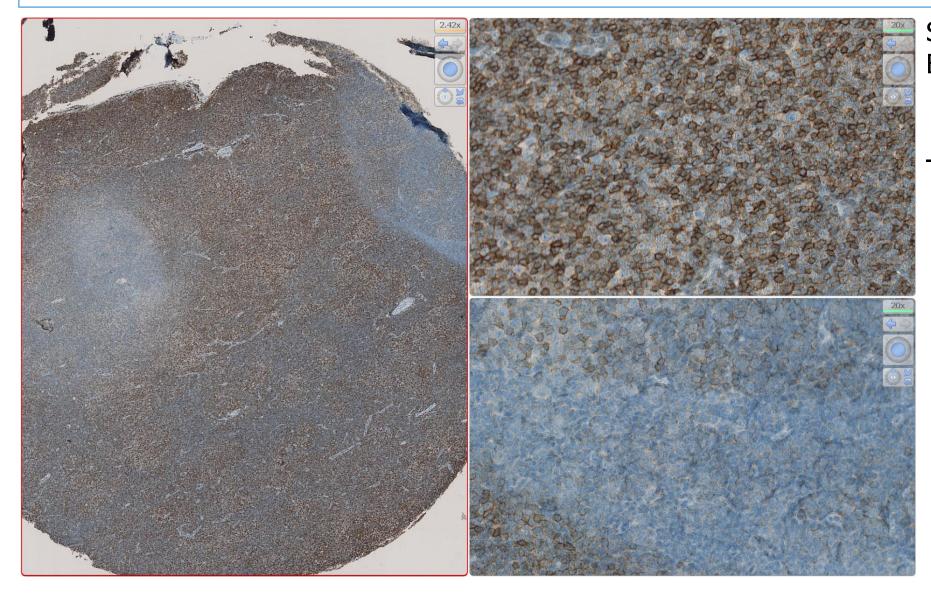

- 1. Flexible protocol set-up e.g. combined retr.
- 2. Flexible reagent choice HIER buffer, detection system
- 3. Both low and high affinity primary antibodies work
- 4. Easy to use loading, programming, maintenance
- 5. Good portofolio of RTU's type I & II plug-and-play

3 main Cons:

- Increased manual interaction 2 instruments needed
- 2. Primarily batch operation
- 3. High reagent volumen needed 300 ul and >"dead-vol"

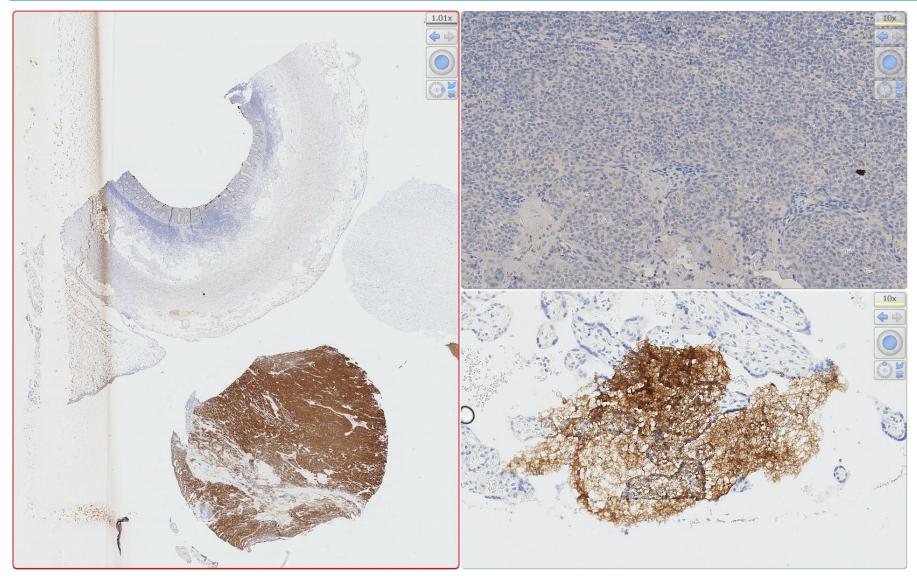

Staining issues BenchMark, VMS;

Uneven weak and neg areas

– air bubbles

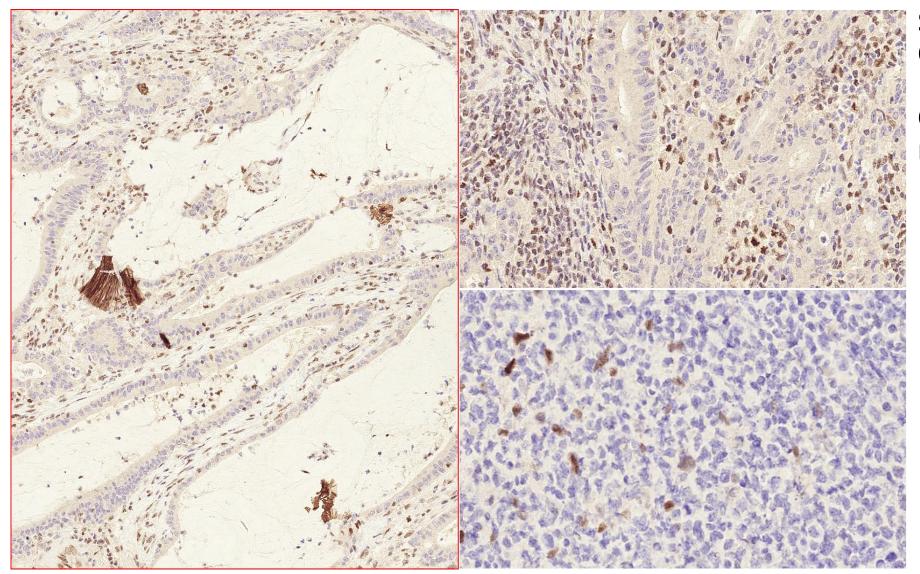

Staining issues Bond, Leica;

Chromogen precipitates and general hue

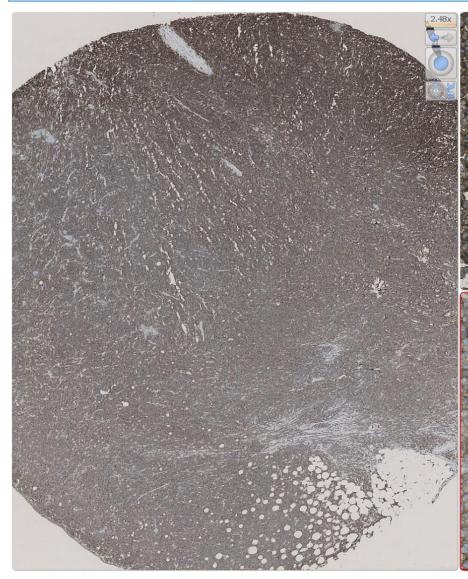

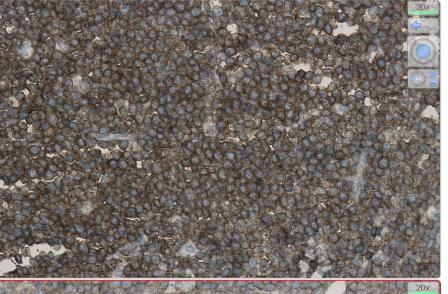

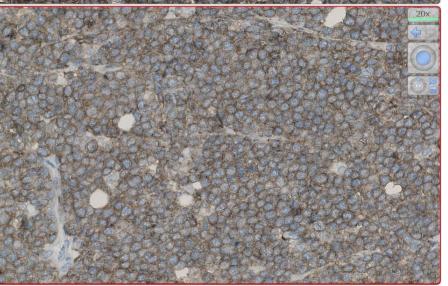

Staining issues Omnis, Dako;

Chromogen precipitates, morphology and general hue

Staining issues AS48, Dako;

Chromogen depletion, reagents not spread, drying out

Issue with rack levelling

and Mogens Vyberg, MD‡\$

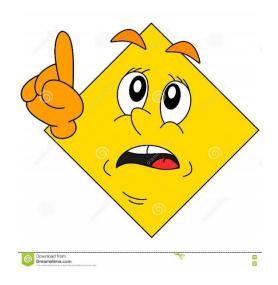

TABLE 3. (continued)

Special Considerations The positive controls should match Cut and submit "own on-slide control" if sending patients' patients' sample tissue processing so far as is possible unstained slides to another laboratory for IHC testing This is difficult if the sender does not know which IHC assays will be performed or if the sender does not have dIHC laboratory and has no positive controls Use on-slide positive controls "Run" or "batch" positive controls are not recommended Date unstained slides with on-slide Without the date when the slides are prepared, it will be impossible controls to determine if a unexpected weak result is due to variation in protocol or to an "expired" positive control

dIHC indicates diagnostic immunohistochemistry; iCAPCs, immunohistochemistry critical assay performance controls; SOP, standard operating procedure.

"even for automated stainers, where it cannot be guaranteed that every slide in fact receives identical treatment".

An Audit of Failed Immunohistochemical Slides in a Clinical Laboratory: The Role of On-Slide Controls

Carol C. Cheung, MD, PhD, JD,*† Clive R. Taylor, MD, DPhil,‡ and Emina E. Torlakovic, MD, PhD†

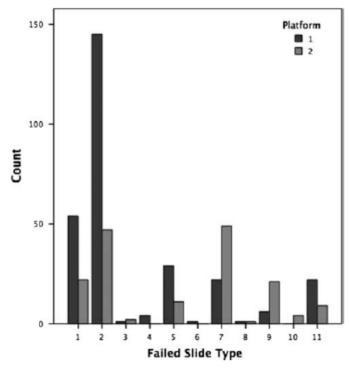

FIGURE 1. Frequency of failed immunohistochemistry slides by category and platform.

2% error rate (452/22.234 slides) Class I 0,8% - Class II 9,0%

Failed IHC Slide	Description	Comments
Category	Description	
1	On-slide control too weak, patient tissue negative	Correct primary Ab was applied, but test sensitivity is possibly too low
2	On-slide control negative, patient tissue negative	Total slide failure; the result of the test does not suggest possible cause of the failure
3	On-slide control too weak, patient tissue weakly positive but no internal control	May indicate decreased technical sensitivity
4	On-slide control negative, patient tissue weakly positive but no internal control	There is uncertainty whether the correct primary Ab was applied or if there was significantly decreased sensitivity
5	No on-slide control, patient tissue negative	Uncertain results; cannot distinguish if the staining was optimal, suboptimal, or total failure
6	No on-slide control, patient tissue positive	No internal control present; lesion positive; failed only if there is uncertainty over whether the proper primary Ab was applied
7	Failed signal-to-noise ratio	Usually too high background; potential false positive, involving both patient sample and on-slide external control
8	Counter staining problem	If severe, may render result uninterpretable
9	Wrong protocol	Wrong protocol selected when >1 protocol for the given primary Ab exists in the system
10	Uneven staining	Large or critical areas of the patient tissue or controls were missed by uneven staining
11	Wrong control	Either wrong tissue control or areas relevant to the test were missing (detached during staining or paraffin block with control tissue cut through)

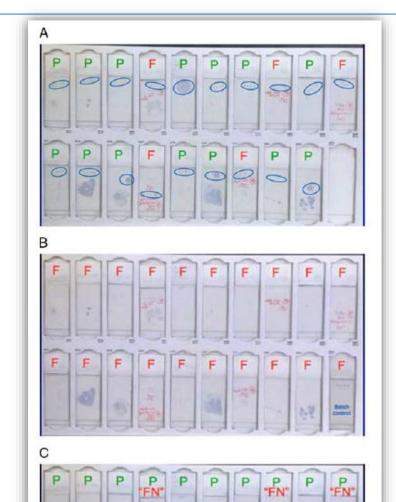

Category 5,6,9,11

Lab related (22%)

Category 1,2,3,4,7,8,10

Assay and/or Instrument (78%)

On-slide controls

IHC slides stained for ALK (Class II), same run, same instrument, same protocol 14/19 passed 5/19 failed

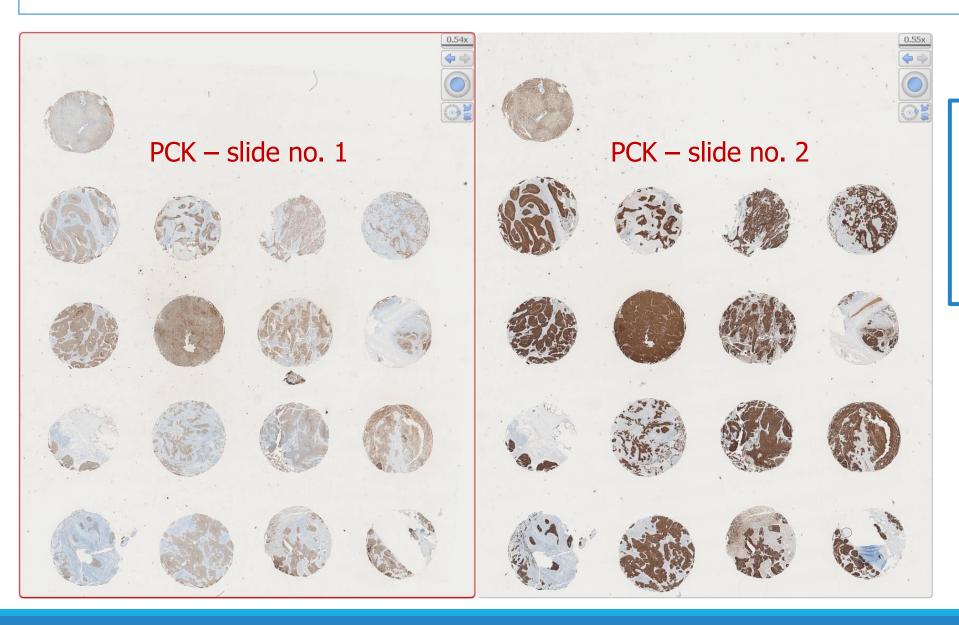

Batch-control - Theoretically:

Batch control fail by same conditions as above 0/19 passed 19/19 failed (no consistent internal control...)

Batch-control - Theoretically:

Batch control pass by same conditions as above 19/19 passed 0/19 failed (the 5 failed slides not identified....)

Consider each slide
position / chamber
on the IHC stainer
as an individual stainer
and use appropriate
on-slide controls

Automation in IHC reduces hands-on and improves consistency However, the quality of the end result is less influenced by the function of the automated stainer compared to the impact of:

- Quality of the tissue material (pre-analytics)
 - Automation will not compensate for delayed fixation etc
- Quality of the reagents used (sensitivity, specificity analytics)
 - Use of detection system with low sensitivity etc
- Accuracy of the technical optimization and validation of the test
 - Use of RTU formats not adequately calibrated etc
- Interpretation of the test
 - Inadequate choice of control material etc

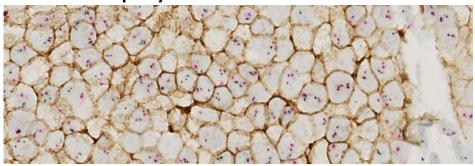

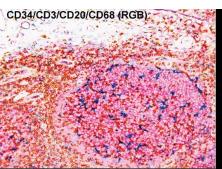

Fully-automated systems: Future ...???

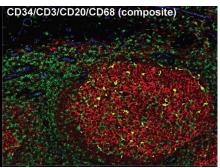

Functionality – Workload – Workflow - Flexibility – Costs

To come:

- 1. Multi-plexing
 - 1. IHC/ISH information on both protein and gene level
 - 2. IHC trible/quadrable staining less sample material
- Reduced IHC staining time shorter TAT required
- 3. Ability to perform ISH for miRNA and similar gene targets
- 4. Increased demand for traceability of IHC process (ISO)
- 5. Multi-functionality IHC, coverslipping, scanning in one device
- 6. New "players" on the market

Fully-automated systems: Future ...???

Fully-automated systems: Future ...??? - New updates and versions

BenchMark ULTRA **PLUS** *Experience the power of PLUS*

The BenchMark ULTRA **PLUS** system

- Optimized workflow. Flexible solutions.
 Quality is at the core
- Built upon the proven technology of the BenchMark ULTRA

Optimized workflow

Improve usability while enabling time for more value-added activities through:

- New light notifications communicate instrument status from acrross the lab
- New retractablework surface gives techs additional space to work while at the instrument
- New bulk reagent color-coded clips make bulk reagent loading easier and minimize errors
- New remote access allows you to view, manage, complete, and print system data remotely
- New integrated communication allows streamlined data management and inventory tracking accross all host computers

Flexible solutions

New features based on user feedback:

- New configuration is shorter than the BenchMark ULTRA
- New integrated touchscreen reduces bottlenecks by allowing many functions to be done at the instrument
- VSS 14.x software allows for easier navigation of inventory management and ordering through a new filter as well as lot-to-lot validation on the same instrument
- New proprietary waste management solution degrades DAB to less than 5 ppb meeting most stringent municipality requirements for nonhazardous waste

Quality is at the CORE

Proven BenchMark technologies deliver the right stain at the right time:

- Flexible, independent temperature control for individual slide staining optimization
- Proven staining technology of air vortex mixing with LCS create a reaction chamber allowing full slide coverage with 100ul of reagent
- New slide drawer design mitigates fluid ingress and egress resulting in continuous and highly-reliable drawer performance
- VSS 14.x software has new and expanded reporting capabilities including QA/QC

Access to perform approved validated companion diagnostic assays for selected predictive biomarkers

	Dako AS48	Dako Omnis	Ventana Ultra	Leica Bond

FOLR1 CDx for ELAHERE ovarian carcinoma	-	-	X	-
Claudin 18.2 for VYLOY gastric carcinoma	-	-	X	-

NO IHC platform allows full portofolio and access to commercially available CDX assays

Conclusions:

Automation in IHC is needed primarily to secure consistency of inter- and intralaboratory results and to reduce hands-on.

There is no perfect system \otimes all have pros and cons. Each laboratory has to select the system being most applicable and favourable for the needs and demands within the laboratory.

Use other laboratories to have a more objective view on the systems offered.

A combination of different systems might be the best solution, as the IHC tests can be performed on the system giving the best technical result and lowest price – drawback workflow....
